## MECHANICAL MOVEMENTS

A Tissot mechnical movement contains an average of 100 finely manufactured parts. The balance wheel lies at the heart of the movement and ensures its accuracy. With its constant backwards and forwards movement, the balance and the balance spring divide the time into equal portions, thereby accurately regulating the movement of time. The movements of the balance spring, called oscillations, are what causes your watch to "tick". The balance wheel's total oscillations equate to 385,000 turns a day.

In all mechanical watches, the energy of the movement is stored in the so-called mainspring which needs to be tightened every day. When fully tightened, the mainspring will release its energy to the movement's wheels during 40 to 80 hours (depending on the model): this is called the power reserve of the watch.

Tissot uses two kinds of mechanical movement: automatic and manual movements.

Manually wound movements: as its name indicates, the power reserve of the watch is manually restored through winding the crown every day. Depending on the model, between 30 to 80 rotations are necessary to completely wind up the energy.

Automatic movements: fitted with an oscillating weight that rotates and tightens the mainspring upon movements of the wearer's wrist, automatic movements do not need to be manually wound every day. However, it is recommended to rewind it through the crown for about 20 turns to ensure the proper functioning of the watch. All our movements are manufactured by the largest manufacturer of Swiss Made movements: ETA, a company of the Swatch Group.

## QUARTZ MOVEMENTS

Tissot has always been ahead of its time, and the high quality of its varied and affordable collection of watches with quartz movements is undeniable.

A Tissot quartz watch contains less parts than a mechanical one, therefore the execution's precision provides valuable results in terms of watch precision. The quartz movement works with two elementary components : a quartz stone (that replaces the balance wheel used in mechanical movements) and a battery (instead the mainspring manually/automatically wound). This battery provides electricity that creates vibrations within the quartz stone at the frequency of $32^{\prime} 768 \mathrm{~Hz}$, which corresponds
to more than 100 times the mechanical movement's precision. These vibrations are divided in steps through the copper coil which delivers it by path to the gear train wheels, creating the second hand jump.

Tissot presents a large variety of quartz movements, starting with the simple three hands to the analogic perpetual calendar. With the Touch Collection, Tissot offers the most complete quartz movement with a maximum of 20 different functions that are useful in every circumstance.

All our movements are manufactured by the largest manufacturer of Swiss Made movements: ETA, a company of the Swatch Group.
